

R&M PATCH GUARD - MORE SECURITY FOR E-2000™

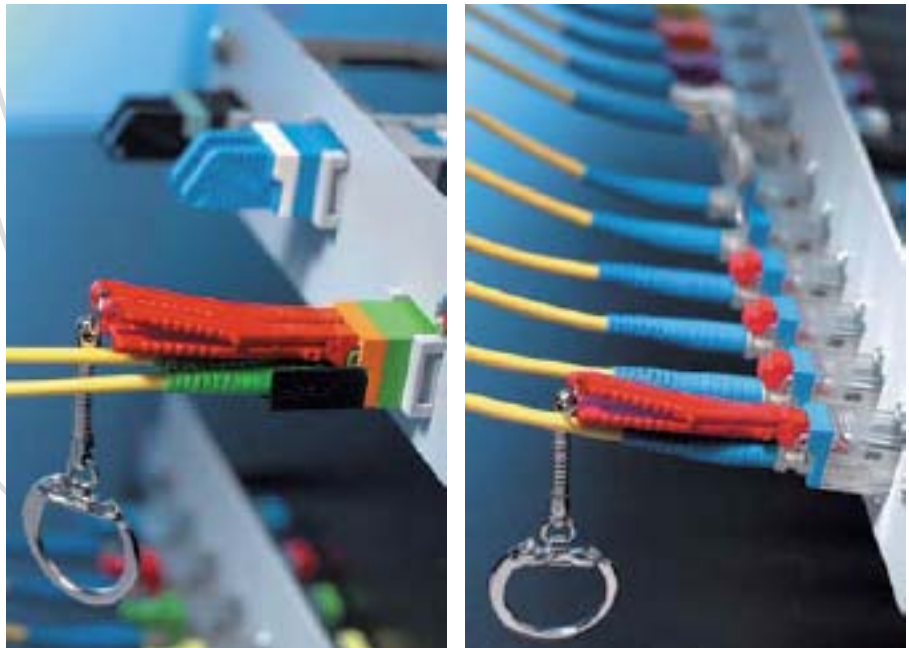

Network interruptions caused by patch cables that were erroneously plugged out or wrongly plugged in frequently have dramatic consequences: transmissions in progress are disrupted, data is lost and customers are unhappy.

The solution is a simple lock.

R&M expanded the three-layer security system with a lockable plug-out protection for the E-2000™ connector family. The Patch Guard for E-2000™ allows telecommunications companies and network operators to significantly increase the security and availability of their fibre optic network with little expenditure.

The Patch Guard components are assembled on the patch cable in a few simple steps. Once the new security solution has been applied, only authorised personnel can remove the connector from the Patch Panel, ensuring a much greater degree of control than otherwise would apply. Incorrect or fraudulent connections will become a thing of the past, ensuring a trouble-free and tamper-free cabling infrastructure. A patent application has been filed for E2000™ Patch Guard, the one-of-a-kind security solution worldwide

Typical fields of application could include large routers, co-location points or Data Centres where access can be gained by numerous people or companies. Network Operators must be particularly

A new security solution for the E-2000™ fibre optic connector. Patch Guard locks the connection which can then only be locked with a special key.

vigilant in preventing errors, including unauthorised patching and manipulation, since every connection disruption can result in financial consequences, with your reputation as a reliable service provider being seriously damaged.

If you are interested in acquiring more information about this product or any other product in the Madison Technologies range, please don't hesitate to contact us. The more we understand your specific needs and requirements, the better the opportunity to find the right solution and "make it happen".
